

### Två datorer, Rak kabel och switch

According to the instructions, I inserted a switch, (2950-24) to the previous network, (PC0 and PC1) and I replaced the copper cross over cable with two straight copper cables and the switch. Both PC0 and PC1 had FastEthernet0 and the switch used FastEthernet0/1 for PC0 and FastEthernet0/2 for PC1

My mistake was that I felt the need, (no logical reason behind it), to activate DHCP, (very wrong decision, I don't know what I was thinking), and I had to write the desirable IP addresses again. After the configuration of the IP addresses I did ping.

Ping from PC0,(192.168.0.90) to the address 192.168.0.91,(PC1). It was successful.

Ping from PC1,(192.168.0.91) to the address 192.168.0.90,(PC0). It was successful.
